Modern Xpress Couriers

A website that says what your business does, an enquiry route that works, and a way to check on a parcel.

Prepared for Modern Xpress Couriers, Lusaka, Zambia · 31 October 2026

No jargon in this deck. Where a technical word is unavoidable, it is explained the first time it appears.

MOSES K TAPFUMA · MVEOS

How to read this pack

Label	What it means
MEASURED	We read your own website on a stated date, and anyone can re-run the check
YOUR FACT	Something only you can tell us. We have written it as a question, never as an assumption
OPEN	Not known from outside. We name who owns it

Nothing in this pack claims a fact about your business that you have not confirmed. That is deliberate: it is what makes the measured findings worth believing.

What we found

Your website is not currently a courier website. It is a website template with a few courier words dropped in — and the template it came from belongs to a hotel and a security company.

Four things a customer feels on the other end:

1. **The "Services" page sells a hotel room.** It describes private rooms, a bar fridge and Netflix at a guesthouse in Vaal Dam — 804 visible characters, most of them about an accommodation booking. **MEASURED, 24 October 2026.**
2. **The social buttons in the header go nowhere.** Across 23 pages: **67 links point at "#"** — 66 of them are social buttons (46 with names, 20 icons). **0 live social destinations. 0 WhatsApp links. 0 LinkedIn links. 0 email links on the site. MEASURED, 24 October 2026.**
3. **Your own content is missing while the template's content is live.** A good, specific blog post from April 2024 exists, listed twice, with no preview image and no structure around it.
4. **There is no way for a customer to check on a parcel.** For a courier that is the most-requested thing a customer does. Today the answer to "where is my parcel?" is a phone call.

And the commercial cost of it, in plain terms:

- A link you share on WhatsApp or Facebook shows as **bare text** — no picture, no description — in the two channels your customers actually use.
- The site **cannot answer "what does this company do?"**
- The site **asks for too little** on the enquiry form, so most conversations start with a phone call that re-types what the form could have asked.
- **Two names in one ecosystem** — "Modern Xpress" and "Modern Express" — split the search result and the trust. The Facebook page and the website do not match by name.
- The site **carries another company's name in the footer of every page**, and one live page says the website is suspended.

The measured detail

Every figure here is dated, and every figure can be re-run by you or by anyone else with the same check.

what we measured	what we found
pages published and reachable	**23**
links pointing at "#"	**67** — 66 social (Facebook 27 · Instagram 23 · LinkedIn 8 · X 8) + 1 newsletter capture
named social buttons	**46** (23 Facebook + 23 Instagram, on all 23 pages)
live social destinations on the site	**0**
WhatsApp / LinkedIn / email links	**0 / 0 / 0**
phone links	**23 occurrences of one number**, on all 23 pages
pages carrying another company's footer credit	**23 of 23**
pages carrying a link-preview picture	**0 of 23** — a shared link shows as bare text
in-page jump links (these are fine)	**19**, measured separately so they are never counted as broken

Two corrections we made to our own numbers before showing them to you. The "67" and the "66" are different counts — one of the 67 is a newsletter signup that quietly sends a visitor's email address and IP address to a mailing list your business does not control. And the phone number appears 23 times, but it is one number.

Read this as movement, not as a score. The test is how many links move from dead to live against a dated starting point — not how many look good on the day.

What we fix first (Phase 1)

Phase 1 is the site you can point at. Nothing here needs a new platform, a new budget or a decision from a board.

what we do	what "done" looks like
Back up everything, then work	A verified backup, a database export and a written way back, before the first change
Remove the template	The hotel and security pages are gone; every live address that must survive has a permanent redirect, not a silent deletion
Write the business on every page	12 real pages, written only from facts you supply and approve — no invented phone number, no invented coverage claim
Rebuild the enquiry form	It asks what is being sent, from where to where and how big, so the first reply is a rate and a plan, not a fact-gathering call
Make shared links look right	Every page gets a title, a description and a picture, so a link shared on WhatsApp or Facebook shows a card instead of bare text
Make it usable	Headings in the right order, one main region, readable on a phone, alt text on images, forms that can be completed with a keyboard
Footer, legal page, privacy page	We build the routes and draft the wording; your lawyer or accountant signs off the legal sentence — we do not write it for you
Security recommendations	Written recommendations to our own platform team, and their written answer, each with a reference you can check
Acceptance	Every gate above re-measured against a dated record, signed by the person you name

What it costs

Two options. The difference is one page.

	Option A — Phase 1	Option B — Phase 1 + the rate-request page
what you get	everything on the previous slide	everything on the previous slide, **plus** a public page where a customer requests a rate: route, size, date, service — handed off to WhatsApp with the phone as the fallback
fixed fee	**ZAR 50 000**	**ZAR 56 000**
VAT	exclusive of VAT	exclusive of VAT
when we start	on receipt of the last of the seven inputs listed on slide 8	same
how you pay	**no deposit. One invoice, at the moment Phase 1 is accepted.** Payment due 30 days	same
if you need to re-spend something	any third-party cost (hosting, domain, messaging, licences) is quoted **at cost, one line at a time, and only after you approve it**	same

On currency. We are quoted in **ZAR**. If you want the quote in **ZMW** or **USD**, say so — we will re-issue it in that currency rather than convert a number on this page, because a converted number has a date and a rate attached to it and we would rather print the real one.

On VAT. VAT is not added unless it is due, and the treatment is confirmed by your accountant, not by us. We do not invent a tax position.

This price is held for 30 days from the date of the formal quotation, which we issue once you have confirmed the five things on slide 8. The wait for your inputs does not extend that period, and no work starts until the last of the seven inputs in slide 8 arrives.

What we will not promise you

This list is as important as the list of features. It is what you are actually buying.

1. **No chat robot on the website before there is real data behind it.** A customer asking "where is my parcel" and getting a confident wrong answer is worse than no chat robot.
2. **No computer-sent reply to a customer without a person reading it.** In logistics, a wrong committed date is a commercial breach.
3. **No model writes your prices, your transit times or your coverage.** Those are commercial and legally binding statements, and they stay human-owned.
4. **No invented reviews, testimonials or performance figures.** Fake customer evidence is fraud.
5. **No arrival-date prediction early.** An invented estimate destroys the trust the rest of the work builds. It is a later phase, gated on measured accuracy against your own transit times.
6. **No legal or compliance conclusion.** What the Zambian Data Protection Act requires of your business is your lawyer's determination, and we will build the controls to point at the sections so their review has something specific to review.
7. **No change of scope by conversation.** A change is priced in a new written document and agreed before it is built.

What we need from you (five things)

These are the five things we asked for, in plain language. Each one unlocks a specific part of the work.

#	what we need	why it matters
1	**Which of your two published numbers takes orders, and which is the fallback**	the enquiry form and the rate page must route to one number, with the other standing behind it
2	**The reply time your desk can actually hold** — for example "same working day"	a rate-request page is a promise about an inbox. If no one owns the inbox, the page collects enquiries nobody answers
3	**WordPress editor access, this week**	this is the content work and the two new pages. We ask for the editor role, not hosting or domain control, to begin
4	**The name of the one person who signs off what is true about the business**	every public claim passes one person. If that is you, that is fine
5	**Which product we design the tracking discovery around:** parcel tracking only, **or** parcel tracking plus vehicle-fleet visibility	the two have different data sources, different costs and different timelines. We will not design the wrong one

Two more, when you can: a company enquiry mailbox with one owner, and whether consignee details are forwarded over WhatsApp today.

And the seven inputs that actually start the work. Phase 1 begins only when the last of these has arrived — not before, and not on a date we pick for you: (1) WordPress editor access; (2) hosting control; (3) staging access; (4) the order-taking number and its fallback; (5) the response standard; (6) the named factual approver; (7) the client facts for the twelve pages. **Until then the fee does not change and the start date simply slides.**

Phases 2 and 3, and the one decision that unlocks them

phase	what happens	how long
Phase 1	Unblock and content integrity — remove the template residue, write the business, fix the naming, add link previews, rebuild the enquiry route	**2–4 weeks**
Phase 2	Channels — the website and the Facebook page as one system: live links, a posting rhythm, enquiry capture wired to the phone and WhatsApp, one brand everywhere	**6–8 weeks**
Phase 3	Tracking — a customer-facing "track my consignment" journey, and a manager's view of where the vehicles are	**discovery first (weeks 1–2), then build (8–12 weeks)**

Phase 3 starts with a discovery, and here is why. The first question is *where does a parcel scan event actually come from* — a handheld scanner, a phone, a dispatch system, or nothing yet. If nothing exists, we build that first. **A build scheduled before that answer exists is a promise we cannot keep.**

That is decision 5 on the previous slide, and it is the only decision that changes the price of Phase 3.

The AI part, in plain terms

AI is not a chat robot, and it is not the thing that fixes the website. It is what makes the operation cheaper to run **after** the site, the channels and the tracking exist.

What it does, in order of what it is worth to you:

- **Enquiry triage** — sorts every enquiry into "rate", "where is my parcel", "complaint", "collection", "partner enquiry", pulls out the origin, destination, size and date, routes it to the right queue, starts the clock, and drafts a first reply for a person to read. **Starts as soon as the enquiry form is live.**
- **Quote assist** — turns "3 boxes of clothes, Johannesburg to Lusaka, before the 20th" into a structured request with an indicative rate band **from your own rate card**, with the assumptions written out, for a person to confirm. **Starts when you give us your rate card and service list.** It never sends and never commits a price.
- **Document reading** — reads a proof of delivery, a waybill or an invoice and pulls the fields out, checks them against the consignment record, and flags anything that does not match. **Starts once your document flow exists.** The minutes it saves are the first-pass reading minutes, not the whole task — a person still checks and files. That review time is a real running cost and we name it in the price rather than pretend it away.
- **Exception alerts, arrival estimates and a customer self-service assistant** — these all need the tracking system first. **They are later phases, and we will not sell them to you as if they were available now.**

The accuracy test is agreed before we run it. For document reading: a labelled sample of 100 real documents, a floor agreed in advance, and a test that **fails the release** if accuracy falls below it. A threshold set after seeing the result is not a threshold.

Your data is not used to train or fine-tune anything. Retrieval-based grounding only, and we propose that as a written term, not a preference.

What it could be worth, in your numbers

We are not going to tell you what this saves. We do not know your numbers, and you do.

So the pack gives you a **worksheet you fill in** — six figures you already have — and it tells you how many consignments a month have to move through the new enquiry route for the fee to pay for itself. **The number you get is one you can defend to your own boss, because you produced it.**

Six inputs: enquiries per month · the share of enquiries lost or delayed because the answer was not instant or complete · revenue per won consignment · the share of consignments lost to a competitor who answered faster · the minutes it takes to give a customer a rate · the cost of answering one enquiry by hand.

And the sentence that matters, said out loud:

> "If the number you get is larger than your monthly volume, this is not worth doing yet — and I would rather tell you that now than take your money."

No AI savings are folded into that number. The AI programme is a separate sequence with its own price. Mixing the two is the first thing a procurement team catches, and it is how a good proposal loses trust.

How we prove it

Every phase ends at a named gate with a written definition of "done", and every gate is re-measured against a dated record.

- A **12-point acceptance baseline** for the site, measured against your own pages, plus gates for content and for channel resolution — the check that a button points at an account you own and that someone posts to it.
- Each gate is re-measured **against a named dated record with a checksum**, not by moving the ruler during the check.
- A **channel baseline** is pinned before the first change. The figure that settles acceptance is the count of links that **moved** against that baseline.
- **We will show you the records.** Every number in this pack is re-runnable by you or by anyone else with the same tool.

No invoice before acceptance. The evidence that comes with the invoice is the same evidence the gate rests on.

Where we would like to be in three weeks

- The hotel and security pages are gone and the site says what the business does.
- The links work: the Facebook page live, and the buttons you do not own removed rather than faked.
- A shared link shows a card with a picture and a description, instead of bare text.
- The rate request reaches the inbox or the number you named.
- **You have the records** — the dated, re-runnable measurement behind every claim we have made.

Then a conversation about Phase 2 and Phase 3, on evidence.

Next step, and who does what

who	what
You	a walk-through call — the five things on slide 8, the two currency choices on slide 6, and the five facts we still need for the twelve pages
You	the approval signature on the quotation, once the five things are confirmed
We	access and backup, then the template residue out and the business written in
We	the records, the receipts and the gate set, shared with you as we go
